

As-Is Process Mapping

1. Visual As-Is Diagram

2. Pain point Evidence:

1. A. Stakeholder quote:

"The current system treats payment promises the same as payment confirmations, which creates confusion." — Veronica Cole, Compliance Officer.

B. Source Dataset:

In `delinquent_accounts_export.csv`, accounts are tagged as `promise_due` (319 accounts) or `plan_requested` (333 accounts). There are no operational pipeline statuses to distinguish between an unverified commitment and a fulfilled payment, forcing agents to manually cross-reference bank statements.

2. A. Stakeholder quote:

"The audit trail is scattered across email, spreadsheets, and the legacy database, making compliance reviews a nightmare." — Andrea Hunt, Operations Manager.

B. Source Dataset:

Recovery activity logs are fragmented almost equally across four separate systems:

- phone: 2,495 records (25.23%)
- spreadsheet: 2,492 records (25.20%)
- legacy_db: 2,453 records (24.80%)
- email: 2,450 records (24.77%)

3. A. Stakeholder quote:

"The collections database does not sync with the email tracker, so agents often re-contact customers who were already promised callbacks." — Christopher Richards, Collections Agent.

B. Source Dataset:

In the `recovery_activity_tracker` document, there is a high Duplicate Rate of the 9,890 total recovery actions, 2,020 actions (20.42%) are flagged with `duplicate_check_flag = 'Y'`. Cross-System Redundancy: Duplicate contact events are spread evenly across all channels, including 507 entries in email and 500 in `legacy_db`.

4. A. Stakeholder quote:

"Simple cases that could be resolved in minutes take days because they get stuck in the wrong queue." — Priya Nair, Product Manager

B. Sourced Dataset:

There is a high Automation Potential when analysing the `delinquent_accounts_export` table. Out of 3,246 delinquent accounts, 2,516 accounts (77.51%) are flagged as self-service candidates (`self_service_candidate` = 'Y' or 'Yes').

5. A. Stakeholder quote:

"No one has visibility of what is actually in the pipeline or how long cases typically take." — Katherine Taylor-Evans, Finance Analyst

B. Sourced Dataset:

- Status Inconsistencies & Missing Data: In `delinquent_accounts_export.csv`, 69 accounts have missing status values (NaN), while active statuses suffer from inconsistent formatting (e.g., Awaiting Follow Up [327] vs. `awaiting_follow_up` [307] vs. awaiting follow up [9]).
- Broken Tracking & Follow-ups: In `recovery_activity_tracker.csv`, 1,465 activity records (14.81%) have a missing `next_follow_up_date`, and 1,275 records (12.89%) record `outcome_code` = 'next_action_unclear'. This renders accurate pipeline velocity measurement and bottleneck identification impossible.

3. Process comparison between actors:

Agents spend a lot of time trying to reconcile information where the legacy system and spreadsheets mismatch. The current inconsistent record keeping causes customers to experience repetitive contact journeys. Contact outcomes are manually inserted in the system, the lack of written confirmation of the promise-to-pay causes duplicate records, which can cause agents to miss and delay contact follow ups. The issue exacerbates when a case must be escalated to the team leader, agents have to make their own judgement calls about which source to trust when there is conflict, reducing case visibility. Time is lost and accounts get neglected.

4. Automation Opportunities

1. Self-automated email of the contact outcome to the customer: this would prevent customers from struggling to remember the outcome of the call, preventing account delinquency to prolong due to customers not remembering what was discussed.
2. Automated list of new delinquency accounts, ordered by delinquency period: Once an account becomes delinquent, it is transferred to a unified system, where the account is ranked by its delinquency period.
3. Self-pay set up for simple cases: in early delinquency cases, a simple portal can allow customers to pay their debts and set up a payment plan. Once the payment is set up, the account will automatically alter its status to agree-to-pay as a yes.
4. Automated follow-up update: Once contact is achieved with a client, an update can be generated to the unified data sheet. This will avoid duplication and confusion for the agents, saving time.
5. Escalation automation: Once a delinquent account enters the late delinquency stage and becomes high risk, an automated email should be generated and sent to a team leader, this will increase visibility and allow managers to coordinate their agents.
6. Digital promise-to-pay capture: When a customer agrees to a promise-to-pay agreement, an automated update would be inserted in the unified dataset spreadsheet.
